APPENDIX B: SUMMARY OF INSTRUMENTATION INSTALLED ON SITE

APPENDIX C: MINUTES CLOSE OUT MEETING AREA 4

1. CLOSE OUT REPORT PURPOSE

As stated in the specification: C122-OVE-Z4-RSP-CR001-00007 Rev 7.0, the purpose of this close-out report is to summarise the data from the instrumentation included in this document and to relate the recorded movements to the construction activities which produce any observed changes. For construction activities it is intended excavation of the C305 twin bored tunnels and dewatering of cross passages; impacts from cross passage excavation or from other CRL contracts are not included in this report.

The long term readings have been used to demonstrate that the subsequent movement has reached an acceptably stable rate within the accuracy of the system in order to decommission and/or that C305 works are no longer impacting the area concerned.

As stated in the specifications the settlement rate of 2 mm/yr has been defined. Where this is not achieved this report seeks agreement from all parties that the rate is acceptably low enough to cease monitoring and decommission.

The settlement rate of monitoring locations, covered by this close-out report, had generally reached the specified rate of 2mm/year post TBM works but they are located in an area affected by dewatering works associated with cross passage construction. Monitoring of instruments close to the dewatering works is included in this report to provide evidence that settlement due to the dewatering works has now reached the specified rate. Therefore by inference, instruments located in the vicinity of the dewatering would have also reached the specified rate.

2. LOCATION OF THE WORKS

The instrumentation is located in and surrounding Orchard Place, which is situated north of the Lower Lea Crossing viaduct.

The majority of the boreholes are situated in close proximity to the River Lea retaining wall, with the exception of the ones situated on the crown of the tunnel. Originally, the proposed location of the boreholes above the tunnel crown was also adjacent to the retaining wall; however due to the location of the National Grid pipeline these had to be relocated. These boreholes were moved from the retaining wall, along the tunnel alignment to the opposite side of the road and were situated along the highway and pavement of Orchard Place.

The section of boreholes situated to the north of the tunnels, are situated within the open ground of the peninsula, at the northern end of Orchard Place. The section of boreholes situated south of the tunnels, are situated along a public footpath between an industrial yard and the Lea River.

See Appendix A for the location of the works drawings.

6. METHODOLOGY

To determine the settlement rate the following methodology has been used. A Linear Regression has been applied for a defined period using long term readings after TBM construction. This uses the following formula.

$$b = \frac{\sum_{i=1}^n (X_i - \bar{X}_i) \cdot (Y_i - \bar{Y}_i)}{\sum_{i=1}^n (X_i - \bar{X}_i)^2}$$

Where:

B =gradient or slope

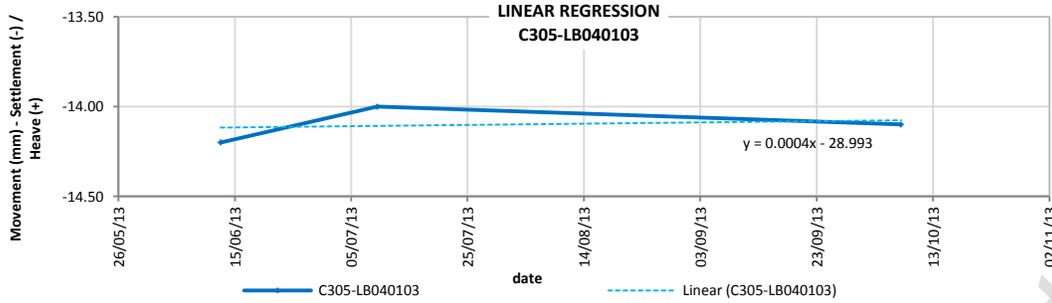

X (independent variable) = date

Y (dependent variable) = vertical movement

From this, the settlement rate per day can be calculated and rate per year determined (negative value is for settlement, positive is for heave). For these values, the percentage at or below 2 mm/yr will be used to determine the trend of the section/area being considered. Also for comparison, values at or below 3mm/year are presented to highlight that the rate is close to achieving the 2 mm/yr. Note the percentages of settlement rate presented in the sections below refer to values rounded to the nearest integer.

One example of this calculation can be seen below for one socket and its projection.

7. SUMMARY OF THE DATA

The methodology described for sockets in section 6 is applied here for rod extensometer sensors.

Note: For the following data plots #N/A refers to instances where readings were not taken for that sensor (e.g. damaged sensor, no access, etc.).

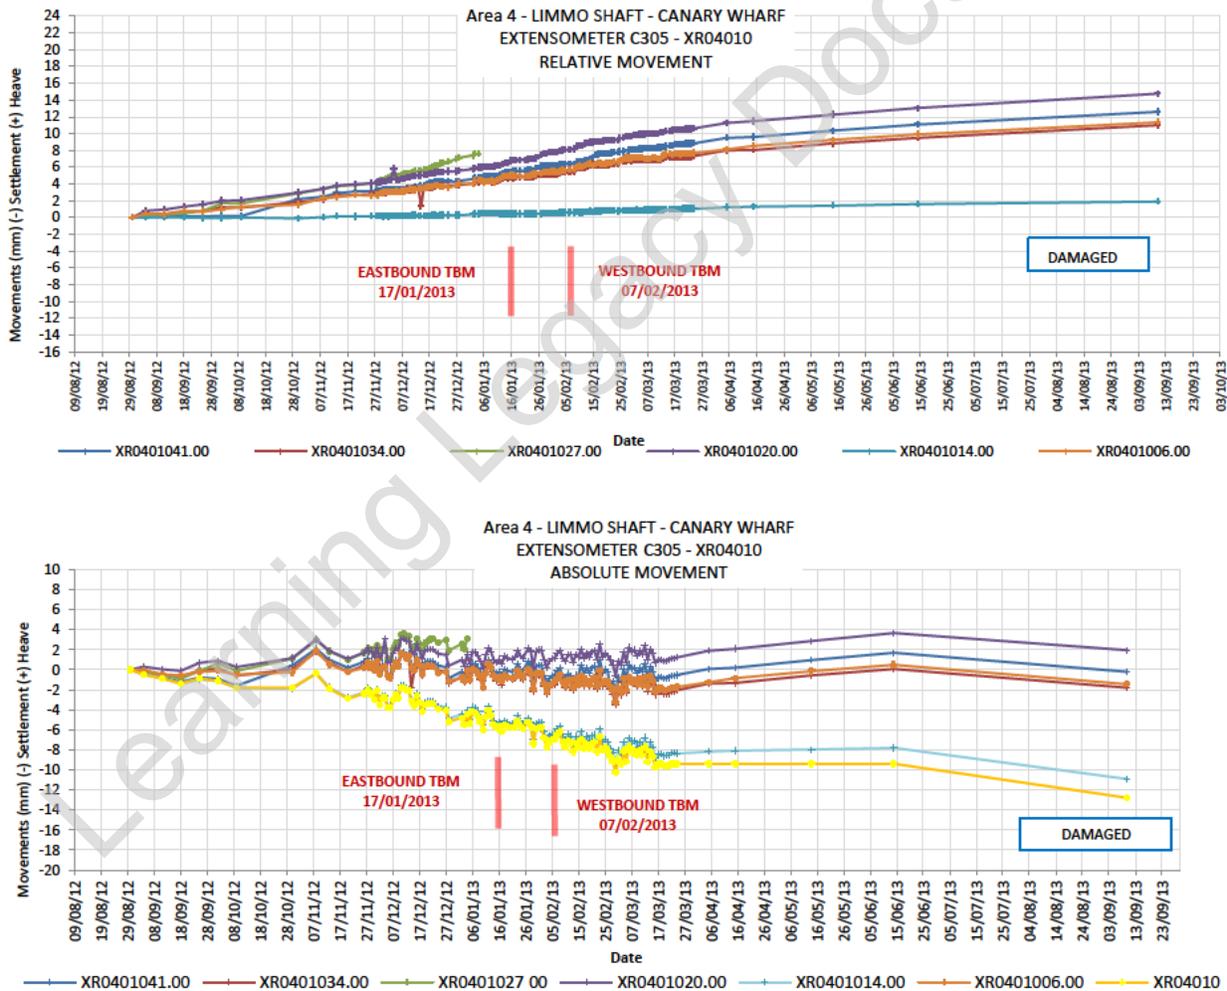

ROD EXTENSOMETERS

- Instrument Type: Rod extensometers
- Quantity: 6

For each rod extensometer two graphs are displayed, showing relative and absolute movements. The relative movement graph represents the movement of the rod extensometers without taking in account the head level elevation whereas in the absolute movement the levelling of the head level has been introduced, adding the value to the relative movement of the rods.

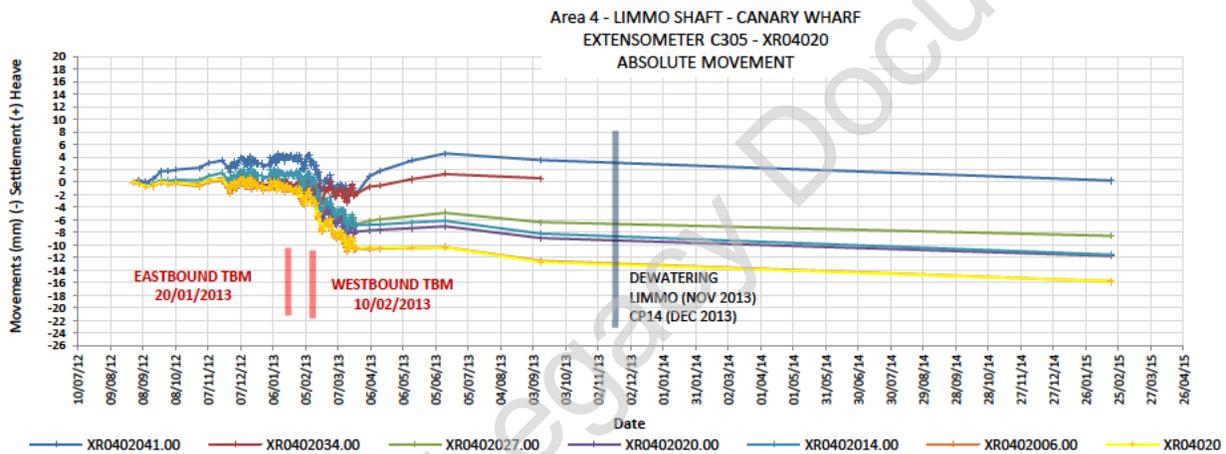

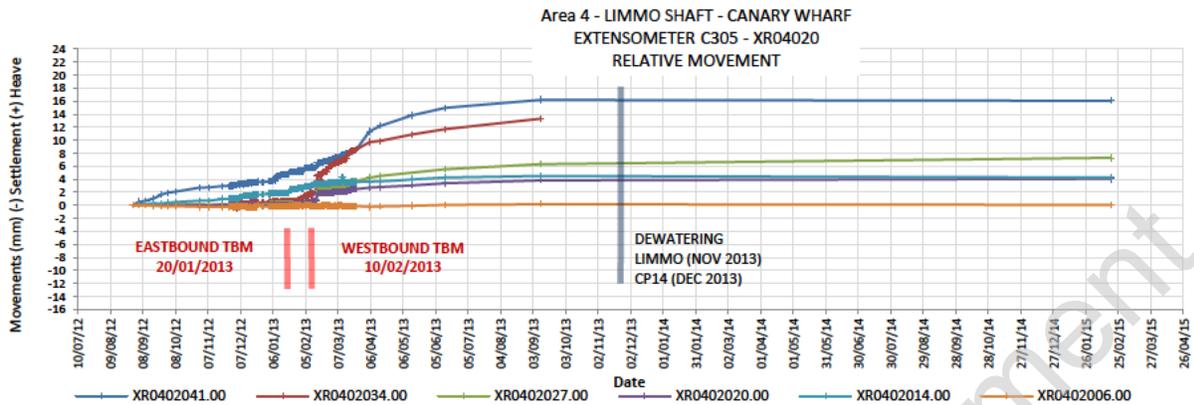

C305-XR04010

Readings of the rod extensometer stopped in September 2013 due to the instrument being damaged by major building works and heavy plant movement.

As can be seen in the graph above the extensometer C305-XR04010 shows an absolute settlement of -8 mm from November 2012 to March 2013.

C305-XR04020

As can be seen in the graph above the extensometer C305-XR04020 shows an absolute settlement of -4 mm during the eastbound TBM transit and an additional -7 mm settlement from the westbound TBM transit.

The effect of the dewatering in the Cross Passage 14 / Limmo can be observed in the graphic above. In order to differentiate the movement due to the TBM transit from the dewatering and analyze whether the rate of change in the data has reached an acceptably small rate, the four readings before the dewatering were used to calculate the annual projection.

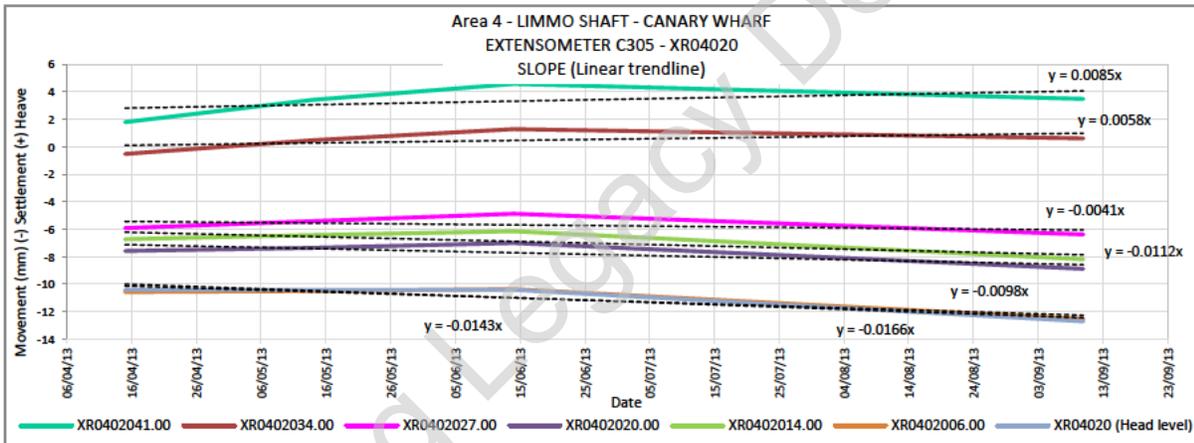

The table below shows the annual rate for each rod of the extensometer.

 #N/A: No readings

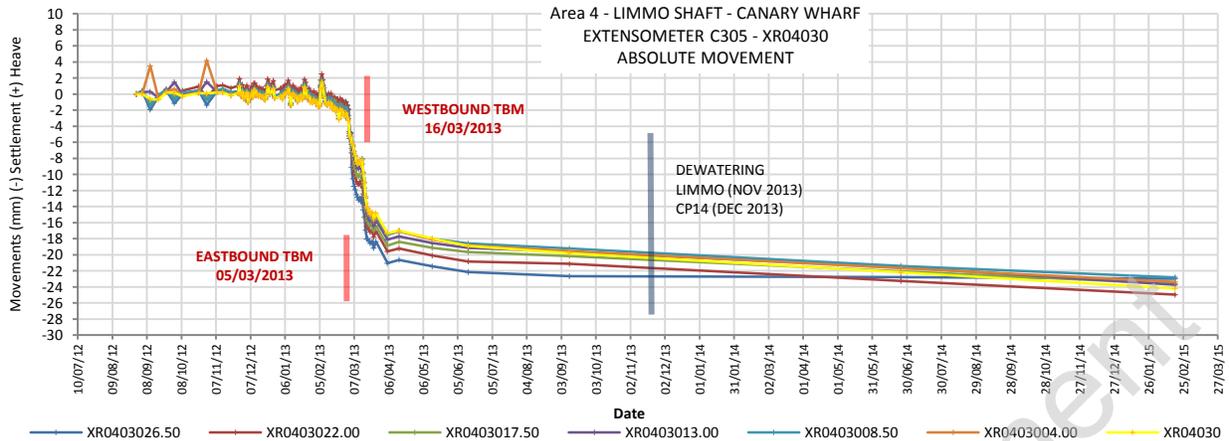

The percentage of the rods with a settlement rate less than 2 mm/year is 42.86% and the same percentage is less than 3 mm/year. See section 8 Summary of movements related to dewatering activities.

The next plot shows the Excel trend line adjustment for each rod.

C305-XR04030

As can be seen in the graph above the extensometer C305-XR04030 shows an absolute settlement of -13 mm during the eastbound TBM transit and an additional -7 mm settlement from the westbound TBM transit.

The effect of the dewatering in the Cross Passage 14 / Limmo can be observed in the graphic above. In order to differentiate the movement due to the TBM transit from the dewatering and analyse whether the rate of change in the data has reached an acceptably small rate, the four readings before the dewatering were used to calculate the annual projection.

The table below shows the annual rate for each rod of the extensometer.

INCLINOMETERS

- Instrument Type: Inclinometers
- Quantity: 4

Four Inclinometers have been installed. A drawing in both instruments includes orientation of “A” and “B” axis and the distance of the instrument from the nearest tunnel drive.

Movements in A+ direction are always to the expected direction, to the axis tunnel, whereas B+ direction is 90° in clockwise direction.

Orientation of the probe and casing:

A axis: the direction of the anticipated movement

A+ = the orientation of the casing groove into which the leading wheel of the inclinometer probe is located on the first run of a set of readings. This is also the orientation of the primary sensor.

A- = the orientation of the casing groove into which the leading wheel of the inclinometer probe is located on the second run of a set of readings. This is also the orientation of the primary sensor.

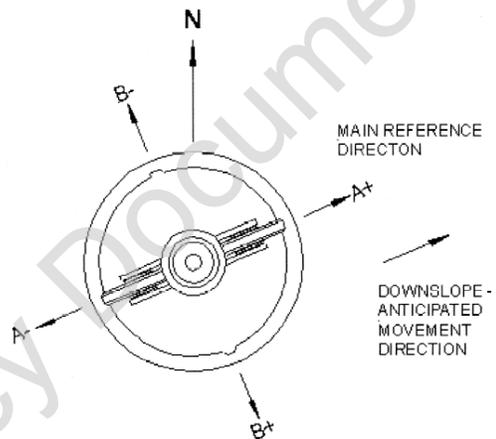

B+ = the orientation of the secondary sensor during the first run of a set of readings.

B- = the orientation of the secondary sensor during the second run of a set of readings.

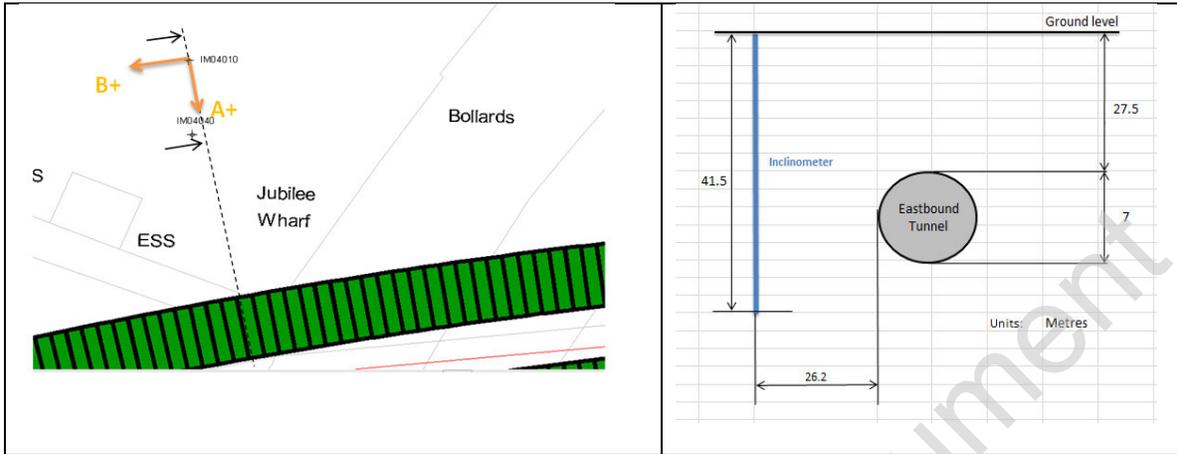

The first reading of the baseline is an average of the three commissioning readings taken prior baseline readings.

Corrections, due to the change of the different probes along the time when the readings were taken, have been applied when using different probes on the raw data. This correction is calculated as the following way. An average of the raw readings along the inclinometer is obtained in each case. Then the difference between the average values before and after the change of the probes is calculated. This difference is applied to the readings taken with the different probe in each direction.

Note: In a meeting between the PM, the Contractor & the Designer, dated 17 March 2016, it was agreed that DSJV will provide a report on inclinometers (“*INCLINOMETERS C-305 RAW DATA AND TWISTING SPIRAL VERIFICATION: C305-DSJ-C2-RGN-CRG03-50373*”), which will include all raw data on excel sheet with dates of different probes used etc.

C305-IM04010

The dates when the TBMs were immediately adjacent to the inclinometer are as follows:

Eastbound Drive-Y	Ring 72 (Project chainage – 84749)	16/01/2013
Westbound Drive-Y	Ring 76 (Project chainage – 84741)	08/02/2013

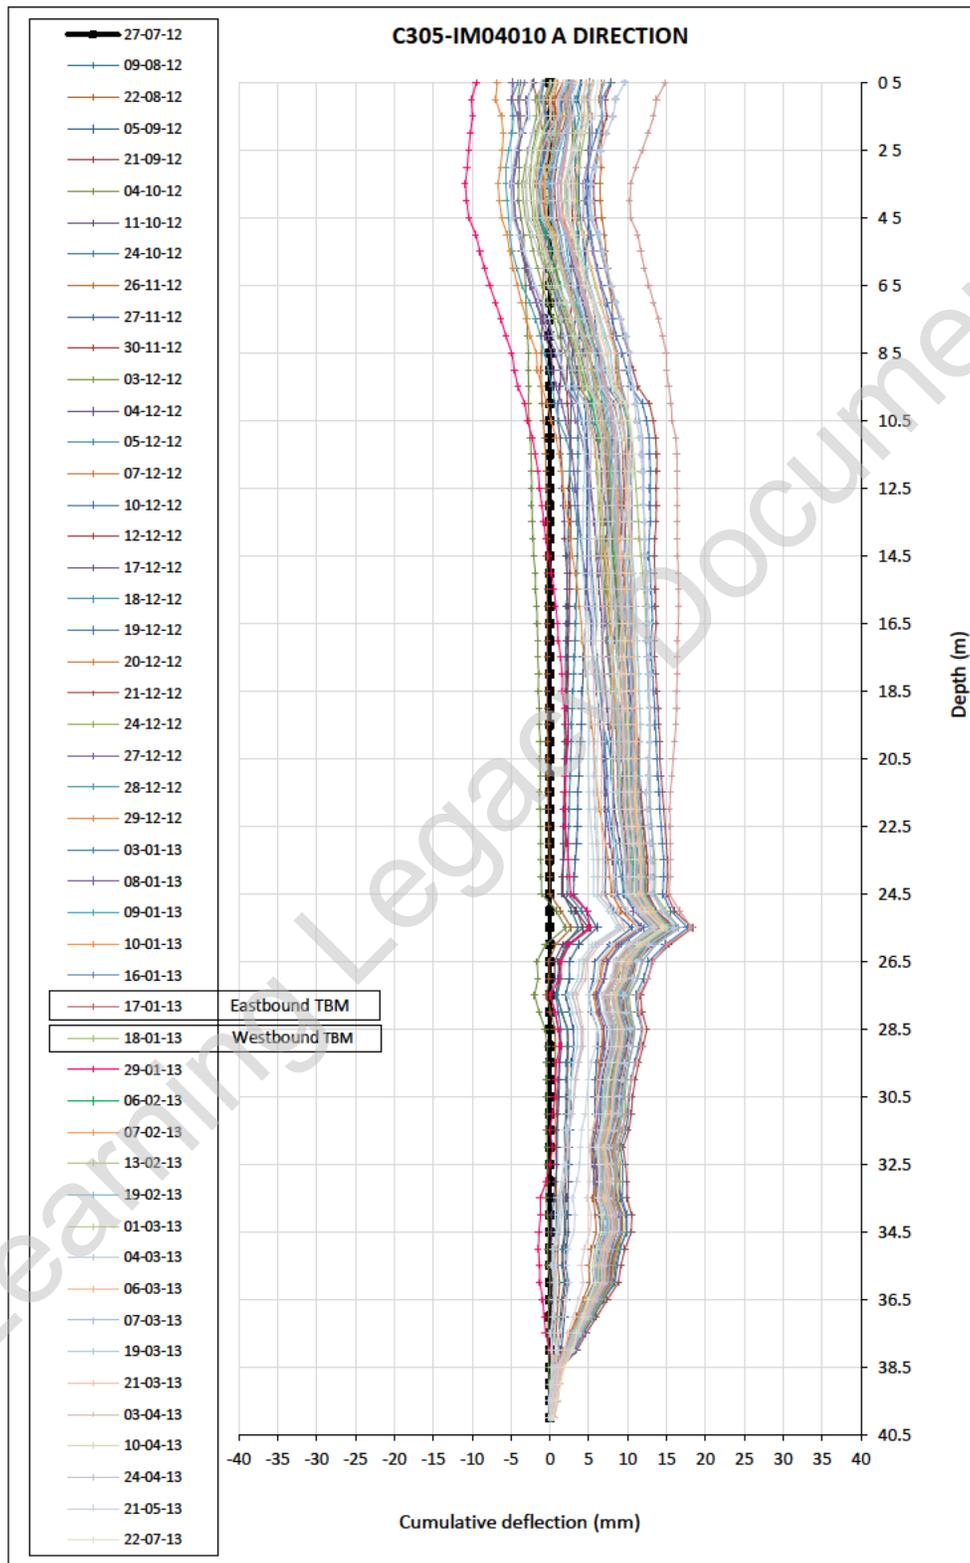

No correction has been applied to the axis probe readings for zero shifts. It plays no part in the deflection or profile calculation and has no effect on the accuracy of the probe. No corrections have been applied for systematic errors.

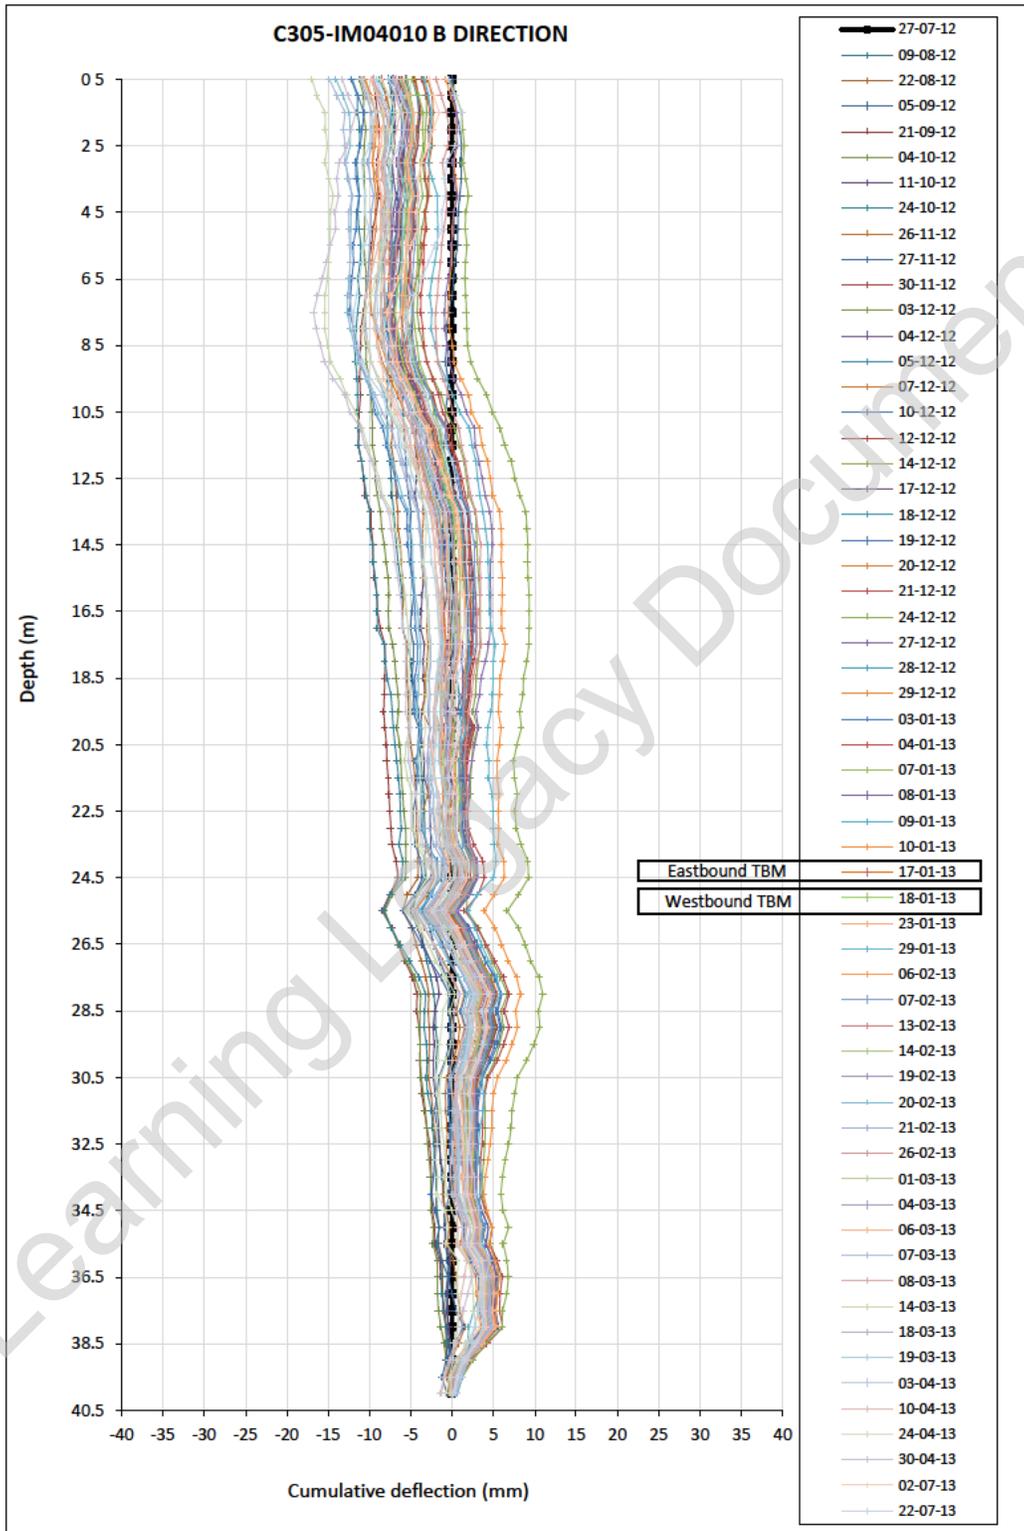

For the inclinometer C305-IM04010 different probes have been used. Related correction factors are presented in the table below:

ID Sensor	C305-IM04010	
Serial number	1032604 to 1035333	1035333 to D11244

A+	-182	38
A-	-174	38
B+	158	28

An evaluation of the data “checksum” has been carried out in order to find errors or erroneous readings. The two values obtained in diametrically opposite directions and at the same depth have been added and checked that these values vary by about +/- 20 digits around the average value. This interval can be larger for the axis B due to the required wheel tolerance in the track. This procedure has been carried out during the course of the survey.

There is no effect due to the TBMs transit in the readings of the inclinometer C305-IM04010.

C305-IM04020

Westbound Drive-Y	Ring 90 (Project chainage – 84717)	13/03/2013

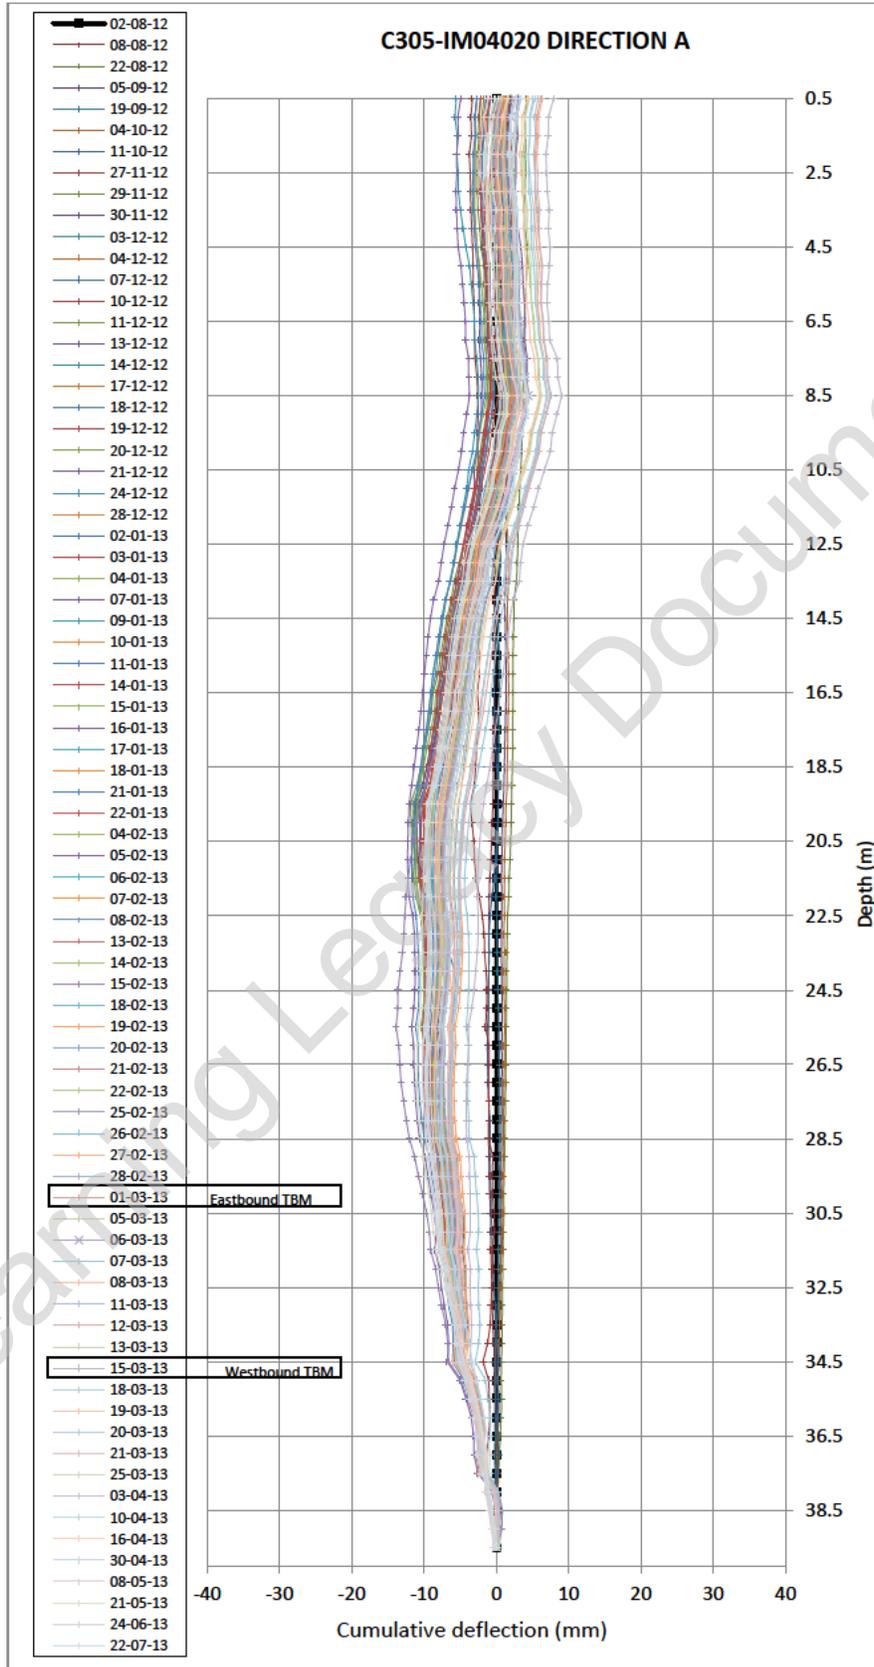

No correction has been applied to the axis probe readings for zero shifts. It plays no part in the deflection or profile calculation and has no effect on the accuracy of the probe. No corrections have been applied for systematic errors.

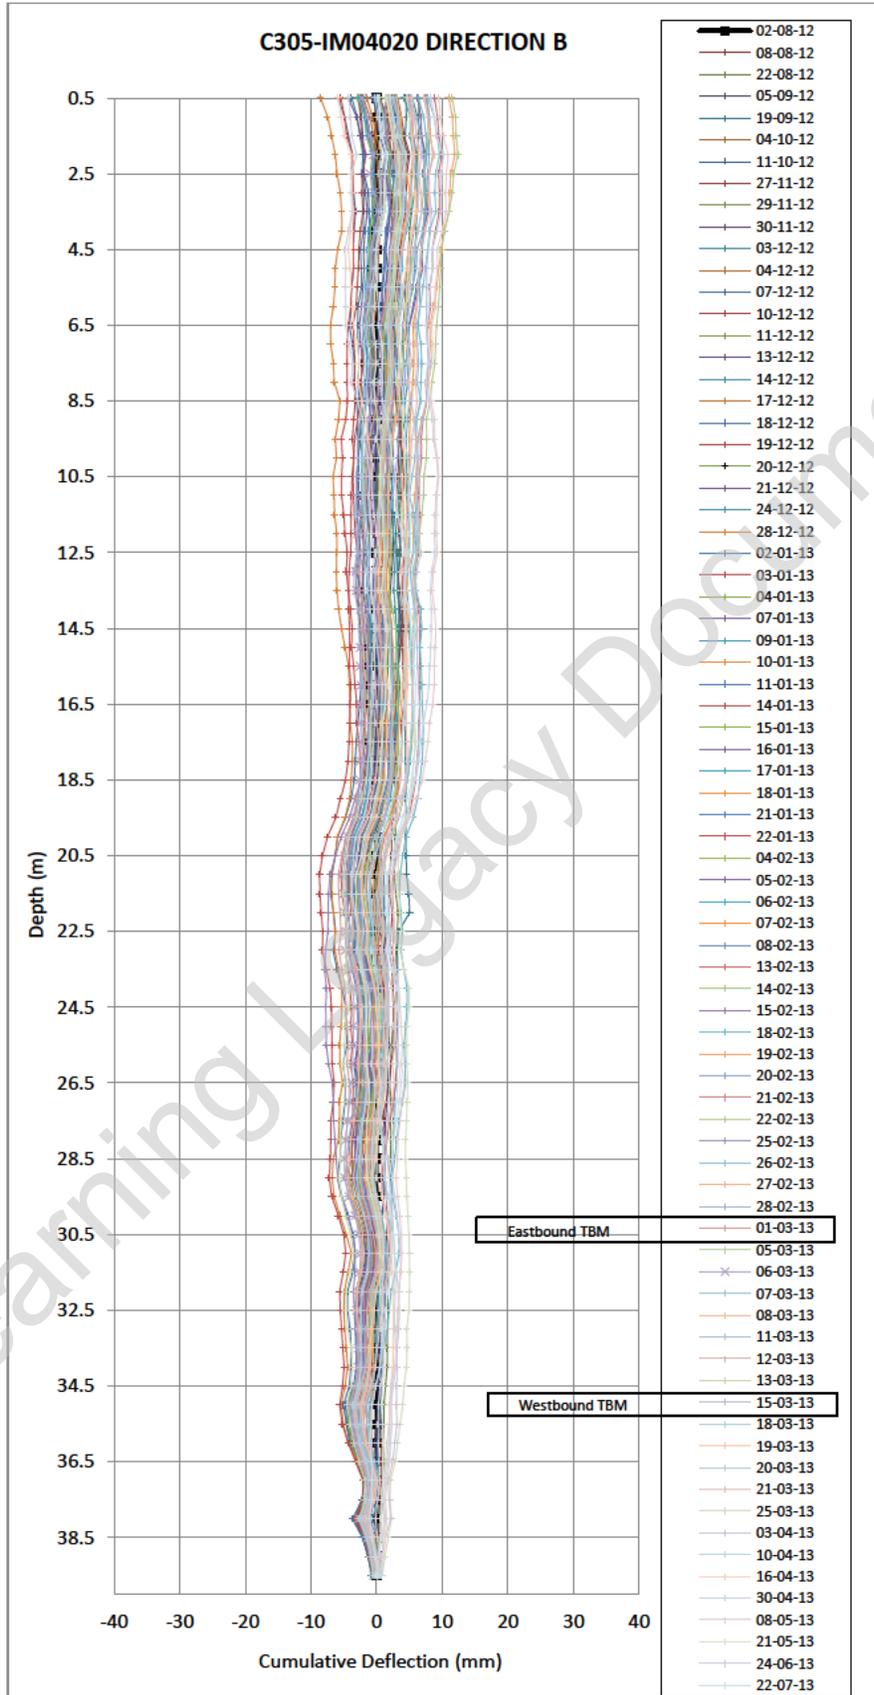

For the inclinometer C305-IM04020 different probes have been used. Related correction factors are presented in the table below:

Westbound Drive-Y	Ring 91 (Project chainage – 84717)	14/03/2013

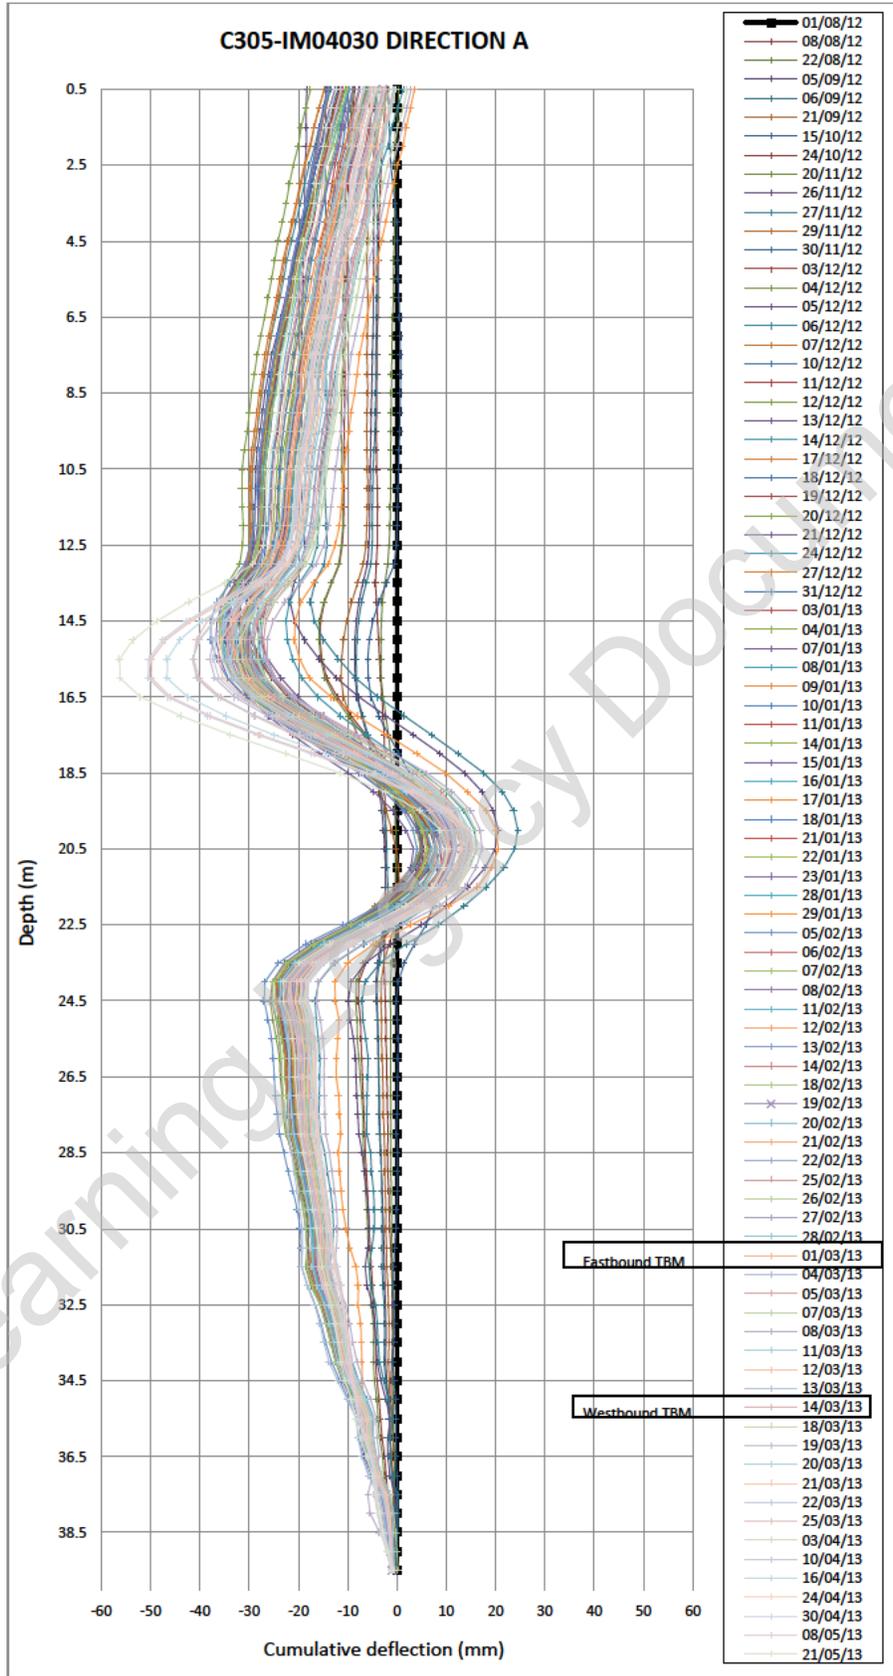

No correction has been applied to the axis probe readings for zero shifts. It plays no part in the deflection or profile calculation and has no effect on the accuracy of the probe. No corrections have been applied for systematic errors.

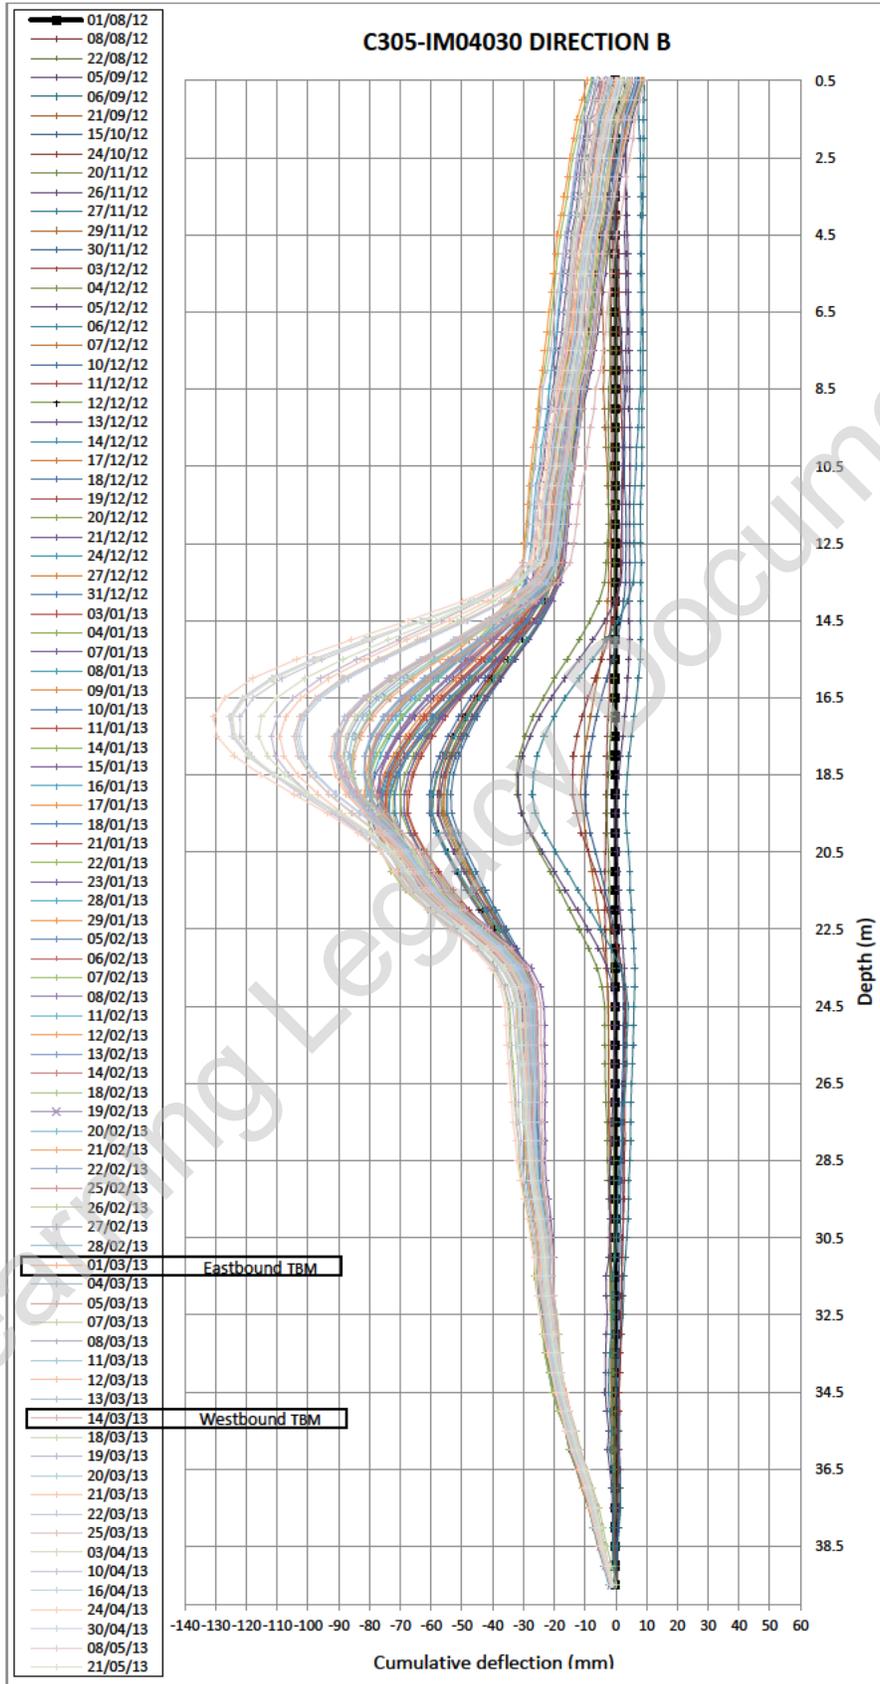

For the inclinometer C305-IM04030 different probes have been used. Related correction factors are presented in the table below:

ID Sensor	C305-IM04030

An evaluation of the data “checksum” has been carried out in order to find errors or erroneous readings. The two values obtained in diametrically opposite directions and at the same depth have been added and checked that these values vary by about +/- 20 digits around the average value. This interval can be larger for the axis B due to the required wheel tolerance in the track. This procedure has been carried out during the course of the survey.

No effects due to the TBMs transit in the readings of the inclinometer C305-IM04030. From depth 14.5 m to 24.5 m the inclinometer readings suffer a distortion due to a wrong installation of the casing.

8. SUMMARY OF MOVEMENTS RELATED TO DEWATERING ACTIVITIES

The effect of dewatering systems being switched on is clearly illustrated in the graphs presented in section 7 above.

Where possible, the monitoring data sets used to calculate the settlement projections in this report were selected up to this stage of works (ie: they do not include the periods affected by dewatering activities). In some instances the period from which the data sets were used to calculate the settlement projections was two months. This limited monitoring period has resulted in slightly higher settlement ratios. Furthermore, for some areas it is evident that dewatering systems were switched on before ground movements could be demonstrated to have stabilised for post TBM works.

Monitoring data graphs from transects installed to monitor the dewatering activities have been included in this report. These graphs present over a year collection of data. The description and location of these transects, relative to this report's instruments are shown in the list and figure below:

- The transect Lower Lea Crossing South Array C305-LP045501 to C305-LP045553 is not covered by this close out report. It is detailed in the Cross Passage 14 and will be included in a separate Close Out Report (I&M Close out report for Cross Passages: Phase I - C305-DSJ-C2-RGN-CRG03-50374).

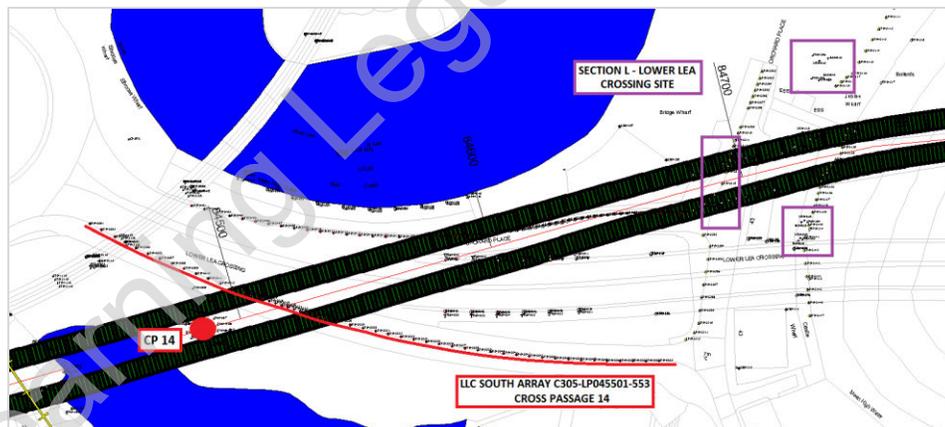

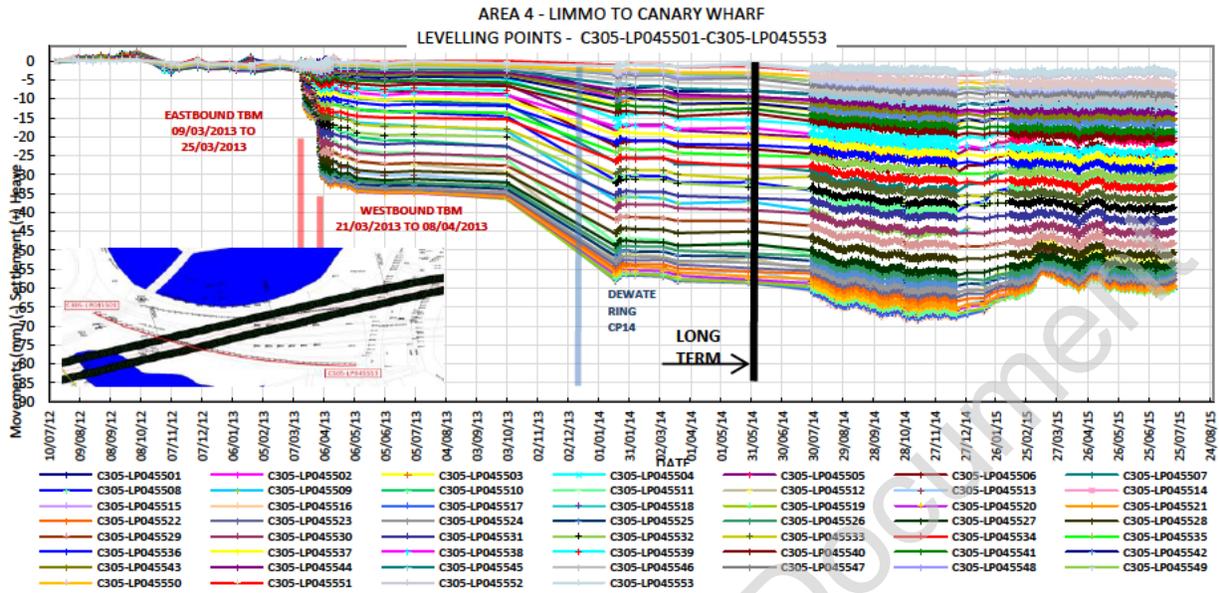

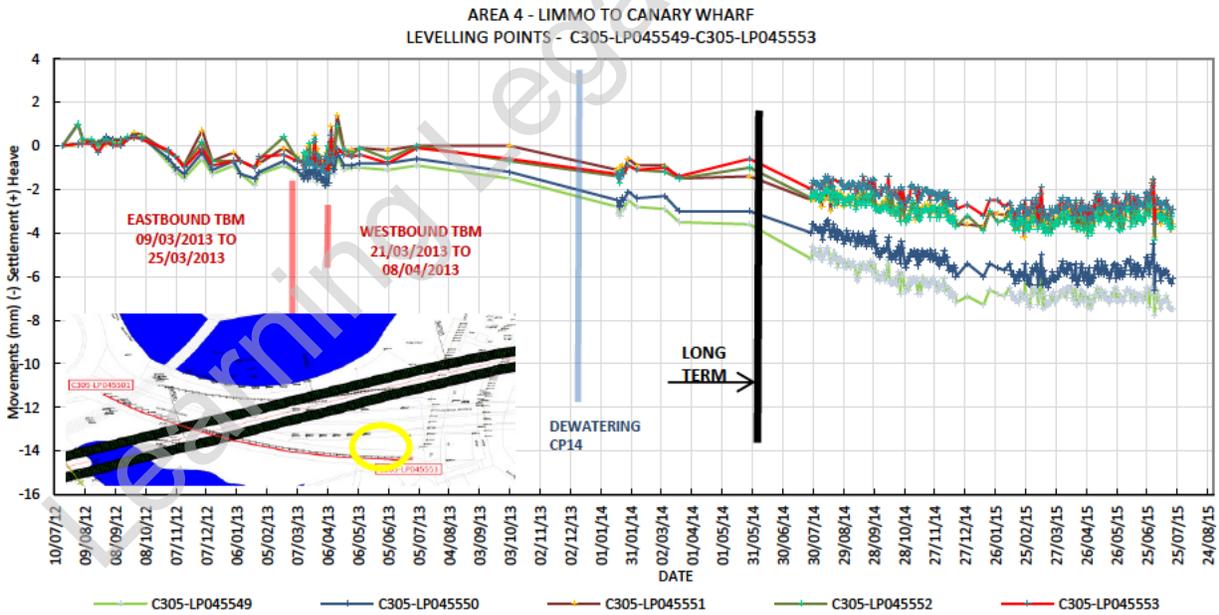

Figure 1: Section L – Lower Lea Crossing site and Cross Passages sections

Lower Lea Crossing South Array C305-LP045501 to C305-LP045553

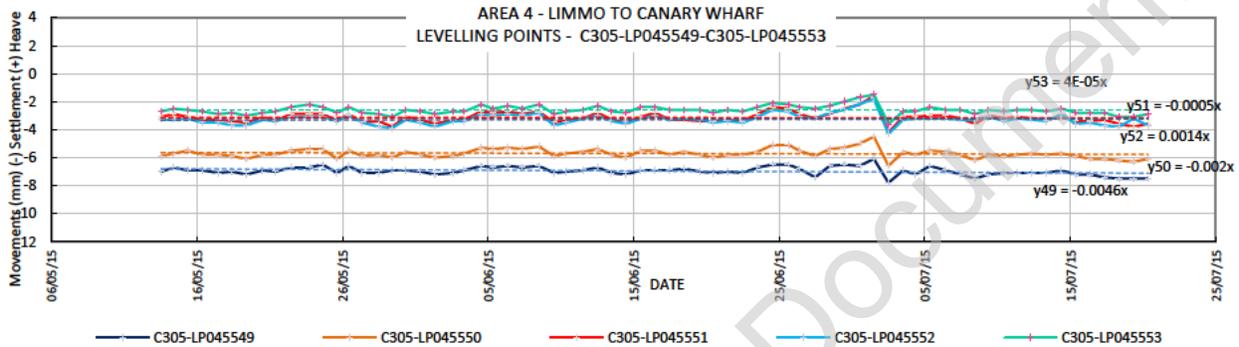

The graph below shows the data of five levelling points (C305-LP045549-C305-LP045553) of the Lower Lea Crossing South Array C305-LP045501 to C305-LP045553. These five levelling points close to the Section L covered in this report, reach an annual rate less than 2mm/year.

The table below shows the annual rate calculated for each of the five levelling points and the graph the trend line adjustment.

	Registered movement (mm)		Rate (mm/year)
C305-LP045549	Data from 13.05.2015 to 20.07.2015		0.015
C305-LP045550			-0.183
C305-LP045551			0.511
C305-LP045552			-0.730
C305-LP045553			-1.679
	Rate less than -2.5 mm/year	% less 2 mm/ year	100.00%
	Rate greater than -3.5 mm/year	% less 3 mm/ year	100.00%

The graphs and tables of settlement rate for both transects show that settlement rate due to dewatering works is less than 2 mm/year. As the instruments in this report are located close to this transect it is concluded that they will behave in a similar manner and hence their settlement rate will be less than the 2 mm/year rate.

9. SUMMARY STATEMENT

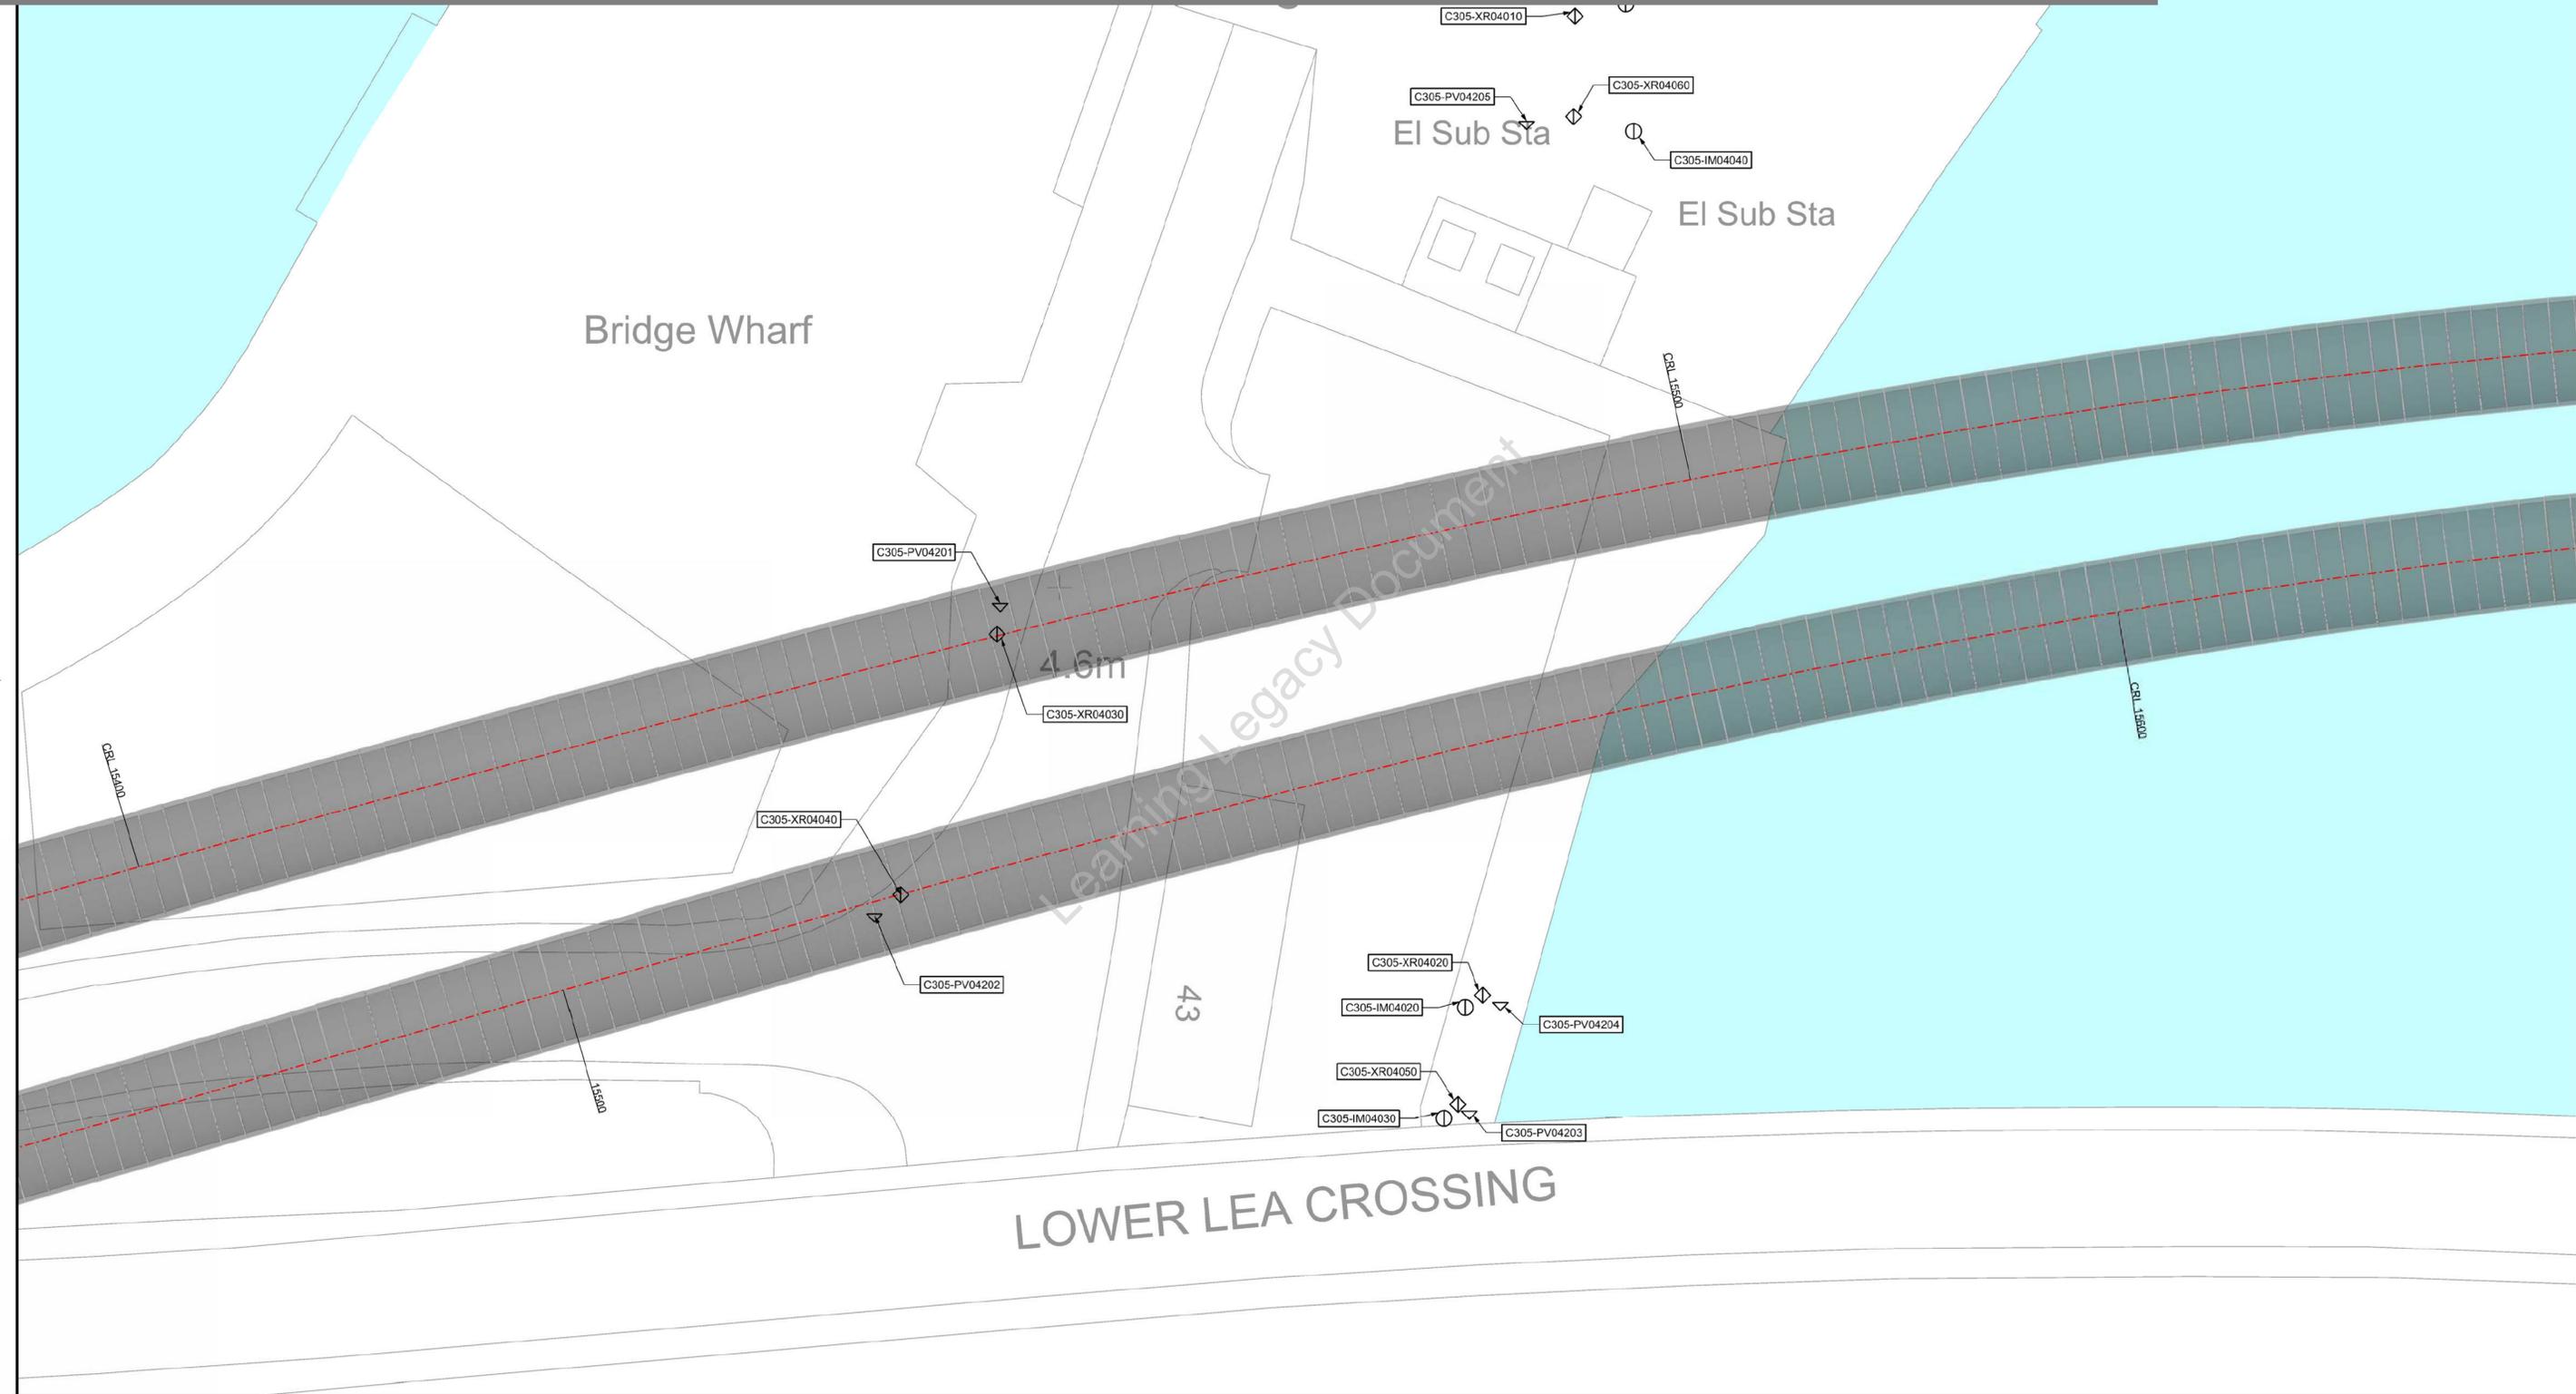

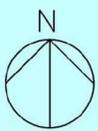

It has been agreed between the Project Manager, the Designer, the Contractor and the Sub Contractor that the instrumentation covered herein, for monitoring ground movement effects of Crossrail works, including long term effects, but which have been subsequently affected by dewatering of cross passages, stations or shafts, prior to the achievement of 12 months 'post-TBM' long term monitoring, can be closed out for decommissioning as the following criteria has been met:

- The trends of the monitoring points, prior to commencement of dewatering, was approaching or had achieved the specified 2 mm/year settlement rate; and
- Local monitoring of the effects of dewatering, directly around the Cross passage 14, shows that ground movement has stabilized to an acceptable rate (<2 mm/year) for a period of at least three months.

Minutes of the Close Out meeting are attached as Appendix C.

Model 6100-1M Inclinometer Calibration Report

Date of Calibration: October 29, 2010
Calibration Instruction: CI-6100 Inclinometer

Inclinometer S/N: 1032604
Technician: ER

Please Note:

Measured $40,000\sin\theta = (\text{Measured } 20,000\sin+\theta) - (\text{Measured } 20,000\sin-\theta)$
 System Accuracy = $((\text{Measured } 40,000\sin\theta) - (\text{Ideal } 40,000\sin\theta)) / 20,000 \times 100$

When using this probe in conjunction with a GK-603 Readout the Internal Bias may be entered in the Probe Configuration as the "A Axis Zero Shift" and the "B Axis Zero Shift". The Gage Factors may also be applied in the Probe Configuration.

When an Inclinometer Probe and a GK-603 are supplied together the Internal Biases and the Gage Factors are entered at the Geokon facility:

Inclinometer Probe S/N:	1032604
A Axis Zero Offset:	30
B Axis Zero Offset:	20
A Axis Gage Factor:	0.6268
B Axis Gage Factor:	0.6274

The instrument above was found to be in tolerance in all operating ranges.

Calibration Issued By: _____ Date: 11-4-10

QA Manager: _____ Date: 11-8-10

The above named instrument has been calibrated by comparison with standards traceable to the NIST, in compliance with ANSI Z-540-1
